Define Sherrington’s law

Sherrington’s law: increased vs decreased innervation to a muscle is accompanied by increased vs decreased innervation to its antagonist.
Define Sherrington’s law

- Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
Define **Sherrington’s law**

- **Sherrington’s law**: *Increased* innervation to a muscle is accompanied by *decreased* innervation to its antagonist

*What is the full name of Sherrington’s law?*
Sherrington’s law of...
Define Sherrington’s law

- Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

What is the full name of Sherrington’s law? Sherrington’s law of…reciprocal innervation
Define Sherrington’s law and Hering’s law

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist

- **Hering’s law**: Innervation to is equal
Define **Sherrington’s law** and **Hering’s law**

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

- **Hering’s law**: Innervation to yoke muscles is equal.
Define Sherrington’s law and Hering’s law,

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

*What is the full name of Hering's law? Hering’s law of...*
Define Sherrington’s law and Hering’s law,

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist

- **Hering’s law**: Innervation to **yoke muscles** is equal

*What is the full name of Hering’s law?*
Hering’s law of…**motor correspondence**
Define Sherrington’s law and Hering’s law

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

*To what does the term yoke muscles refer?*
Define Sherrington’s law and Hering’s law.

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to **yoke muscles** is equal.

*To what does the term yoke muscles refer?* It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law.

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

**Speaking of positions of gaze…** How many positions are used in evaluating ocular motility and alignment?

Nine positions are used, divided into:
- Primary position
- Cardinal positions
- Up and down

**To what does the term yoke muscles refer?**
It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law.

- Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- Hering’s law: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.
  - To what does the term yoke muscles refer?
    - It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment?
- Nine

*The nine positions are divided into three groups—what are they?*
Define Sherrington’s law and Hering’s law

Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering’s law: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine.

The nine positions are divided into three groups—what are they?
--Primary position
--Cardinal positions
--Up and down

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law.

Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

Violated in Duane syndrome.

Hering’s law: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine.

The nine are divided into:

--Primary position
--Cardinal positions
--Up and down

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there?

There are six cardinal positions of gaze.

To what does the term yoke muscles refer?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law

Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering’s law: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups—primary position, cardinal positions, and up and down.

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that nine gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh) and ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.
Define Sherrington’s law and Hering’s law

- **Sherrington’s law:** Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law:** Innervation to yoke muscles is equal.

---

**Sherrington’s Law vs Hering’s Law**

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment?

- **Nine**
  - The nine positions are divided into three groups—
    - Primary position
    - Cardinal positions
    - Up and down

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions... First, how many ‘cardinal positions’ are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs.

To what does the term yoke muscles refer?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Sherrington’s Law vs Hering’s Law

- **Sherrington’s Law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s Law**: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer?
It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law.

Sherrington’s Law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering’s Law: Innervation to yoke muscles is equal.

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment? Nine.

The nine positions are divided into groups—what are they?

--Primary position (1)
--Cardinal positions (6, as 'up' and 'down' are already counted)
--Up and down (2)

OK, I know what primary gaze is, and 'up and down' seem obvious. But as for the so-called cardinal positions... First, how many 'cardinal positions' are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs. There's one primary gaze (duh)... plus 'up' and 'down' make three. This implies (correctly) that there are six cardinal positions of gaze.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law

- Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.
- Hering’s law: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine.

The nine positions are divided into three groups—
- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)…plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law.

Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering’s law: Innervation to yoke muscles is equal.

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups—

1. Primary position (1)
2. Cardinal positions (6)
3. Up and down (2)

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions... First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions.

What is a cardinal position of gaze?

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal. It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine

The nine positions are divided into three groups—

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.

What is a cardinal position of gaze?
One that corresponds to the field of action for a given EOM.
To what does the term yoke muscles refer?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

Sherrington’s Law vs Hering’s Law

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine

The nine positions are divided into three groups—what are they?

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze?

Ok, then what is a field of action?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
To what does the term yoke muscles refer?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine.

The nine positions are divided into three groups—

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)…plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.

What is a field of action?

It is a gaze direction in which the influence of a given EOM is mostly readily apparent. In essence, it’s the position in which a given EOM ‘cannot hide’—ie, the gaze direction in which a given muscle will be ‘exposed’ if it is not functioning properly.
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal. The innervation is the same for both eyes.

---

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment?

Nine. The nine positions are divided into three groups—what are they?

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions... First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze? What are the six cardinal positions of gaze?

---

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law, and for each state the classic example in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - **Violated in**: Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

---

**Sherrington’s Law vs Hering’s Law**

- **Up and right**
  - **Right**
  - **Down and right**

- **Up and left**
  - **Left**
  - **Down and left**

---

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment?

- **Nine**

The nine positions are divided into three groups—

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions... First, how many ‘cardinal positions’ are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus ‘up’ and ‘down’ make three. This implies (correctly) **What are the six cardinal positions of gaze?**

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine.

The nine positions are divided into three groups—

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

OK, I know what primary gaze is, and ‘up and down’ seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)…plus ‘up’ and ‘down’ make three. This implies (correctly) **What are the six cardinal positions of gaze?**

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Sherrington's law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering's law: Innervation to yoke muscles is equal. It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Why aren't straight up and down cardinal positions? Because both involve the action of multiple EOMs. Thus, identifying a deficit in these positions is noncontributory in that it doesn’t allow one to attribute that deficit to the dysfunction of a single, unique EOM.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups—

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

Right Left

Up and
right

Down and
left

Down and
right

Up and
left

The nine positions are used in evaluating the EOMs. There's one primary gaze (duh… plus ‘up and down’ make three. This implies that there are six cardinal positions of gaze.

Why aren't straight up and down cardinal positions? Because both involve the action of multiple EOMs. Thus, identifying a deficit in these positions is noncontributory in that it doesn’t allow one to attribute that deficit to the dysfunction of a single, unique EOM.

What are the yoke muscles? They refer to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

To what do the primary gaze positions refer? They refer to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

What are the primary gaze positions? The primary gaze positions are used in evaluating the EOMs. They refer to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Why aren't straight up and down cardinal positions? Because both involve the action of multiple EOMs. Thus, identifying a deficit in these positions is noncontributory in that it doesn’t allow one to attribute that deficit to the dysfunction of a single, unique EOM.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist

- **Violated in**... Duane syndrome

**Hering's law**: Innervation to yoke muscles is equal

- **To what does the term yoke muscles refer?**
  It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze

**Sherrington’s Law vs Hering’s Law**

---

- **Up and right**
- **Up and left**
- **Down and right**
- **Down and left**

OK, let’s identify the yoke muscle for the cardinal positions of gaze. *Let’s start with an easy one.*

What are the yoke muscles for **right gaze**? That is, for each eye, which muscle is chiefly responsible for straight-right gaze?

---

**Speaking of positions of gaze…** How many positions are used in evaluating ocular motility and alignment?

Nine

The nine positions are divided into three groups—

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

OK, I know what primary gaze is, and 'up and down' seem obvious. But as for the so-called cardinal positions… First, how many 'cardinal positions' are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)… plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.

**What are the yoke muscles for right gaze?**

- OD → ?
- OS → ?

- **Right**

---

To what does the term yoke muscles refer?

It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

**Hering's law**: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

### Sherrington’s law
- Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
- Violated in... Duane syndrome.

### Hering’s law
- Innervation to yoke muscles is equal.
- To what does the term yoke muscles refer?
  - It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Sherrington’s Law vs Hering’s Law

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment?

Nine

The nine positions are divided into three groups—

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

OK, I know what primary gaze is, and 'up and down' seem obvious. But as for the so-called cardinal positions... First, how many 'cardinal positions' are there?

Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)... plus 'up' and 'down' make three. This implies (correctly) that there are six cardinal positions of gaze?

So if, say, the right eye cannot turn to the right, the preferred description would be *the right eye has a deficit in the field of action of the lateral rectus.*
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups—

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

So if, say, the right eye cannot turn to the right, the preferred description would be: **the right eye has a deficit in the field of action of the lateral rectus**.

That seems unnecessarily wordy. If the right eye won’t turn right, why not simply say ‘Yo, the right LR ain’t working’? Because an inability of the right eye to abduct is not necessarily indicative of LR dysfunction. For example, LR function might be fully intact, but a medial restrictive process—say, entrapment of the MR in a healed medial-wall fracture—could be present.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

**Hering's law**: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

The nine positions are divided into three groups:

--Primary position (1)
--Cardinal positions (6)
--Up and down (2)

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine

That seems unnecessarily wordy. If the right eye won’t turn right, why not simply say ‘Yo, the right LR ain’t working’? Because an inability of the right eye to abduct is not necessarily indicative of LR dysfunction.

So if, say, the right eye cannot turn to the right, the preferred description would be ‘the right eye has a deficit in the field of action of the lateral rectus’.

--Up and down (2)

OK, I know what primary gaze is, and 'up and down' seem obvious. But as for the so-called cardinal positions…First, how many ‘cardinal positions’ are there? Well, we just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)…plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze?

What are the yoke muscle for gaze up and right?

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering's law**: Innervation to yoke muscles is equal.
  - To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Sherrington’s Law vs Hering’s Law

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment?

Nine

The nine positions are divided into three groups—

- *Primary position (1)*
- *Cardinal positions (6)*
- *Up and down (2)*

Likewise, the yoke muscles for gaze up and left are again the mirror image of those on the other side.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington's Law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.
- **Hering's Law**: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

**Sherrington’s Law vs Hering’s Law**

- **Primary position (1)**
- **Cardinal positions (6)**
- **Up and down (2)**

Speaking of positions of gaze… How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups: primary position, cardinal positions, and up and down.

- **Primary positions**: One primary gaze (duh)… plus ‘up’ and ‘down’ make three. This implies six cardinal positions of gaze.

The yoke muscles are used to put the eyes into a given position of gaze.

What are the yoke muscles for gaze down and right?
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal. To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

---

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

---

What are the yoke muscles for gaze down and right?

---

Sherrington's Law vs Hering's Law

---

Speaking of positions of gaze…How many positions are used in evaluating ocular motility and alignment? Nine. The nine positions are divided into three groups—

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

What are the cardinal positions of gaze? We just said that 9 gaze positions are used in evaluating the EOMs. There’s one primary gaze (duh)…plus ‘up’ and ‘down’ make three. This implies (correctly) that there are six cardinal positions of gaze.

---

What are the yoke muscle for gaze down and right?

---

To which does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

What are the yoke muscles for gaze down and right?
Sherrington's Law vs Hering's Law

Sherrington's Law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

Hering's Law: Innervation to yoke muscles is equal.

To what does the term yoke muscles refer? It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

Sherrington's Law vs Hering's Law

Speaking of positions of gaze... How many positions are used in evaluating ocular motility and alignment? Nine.

The nine positions are divided into three groups—what are they?
-- Primary position (1)
-- Cardinal positions (6)
-- Up and down (2)

As expected, the yoke muscles for gaze down and left are the mirror image of those on the other side.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in…Duane syndrome

- **Hering's law**: Innervation to yoke muscles is equal.
  - To what does the term yoke muscles refer?
    - It refers to the two muscles—one for each eye—that are responsible for putting the eyes into a given position of gaze.

**Sherrington’s Law vs Hering’s Law**

The cardinal positions of gaze, and the yoke muscles for each:

- Primary position (1)
- Cardinal positions (6)
- Up and down (2)

---

**Note:** The diagram illustrates the cardinal positions of gaze and the yoke muscles for each eye. The positions are as follows:

- **Primary position**: OD → SR, OS → IO
- **Cardinal positions**: OD → LR, OS → MR
- **Up and down**: OD → IR, OS → SO
- **Right and left**: OD → SR → OS, OS → IR → OD
- **Diagonal gaze**: OD → LR → OS → MR, OS → MR → OD

---

**Summary Slide:** Proceed when ready.
Define Sherrington’s law and Hering’s law.

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in...Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

Speaking of Hering’s law... What determines the total amount of innervational input the eyes receive?
Define Sherrington’s law and Hering’s law

Sherrington’s law: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

Hering’s law: Innervation to yoke muscles is equal.

Speaking of Hering’s law…What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.
Define **Sherrington’s law** and **Hering’s law**

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.

**Speaking of Hering’s law...** What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

**OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?**
Define Sherrington’s law and Hering’s law

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

- **Hering’s law**: Innervation to yoke muscles is equal.

Speaking of Hering’s law... What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. 

Violated in Duane syndrome.

**Hering's law**: Innervation to yoke muscles is equal.

Speaking of Hering's law... What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are fixating at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn't. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.

Consider a pt with a paretic right lateral rectus (RLR).

Increased innervation to a muscle is accompanied by decreased innervation to its antagonist...
Sherrington’s Law vs Hering’s Law

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR.

Sherrington’s law

Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

Speaking of Hering’s law…What determines the total amount of innervational input the eyes receive?

It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?

When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.

Hering’s law

Innervation to yoke muscles is equal.
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

**Hering’s law**: Innervation to yoke muscles is equal. Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervational input will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Speaking of Hering’s law... What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position. OK, but both eyes are pointing at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, **which eye is fixating has an enormous effect on the amount of innervational input.**
Define Sherrington's law and Hering's law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington's law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering's law**: Innervation to yoke muscles is equal.

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to cause the eye to Abduct, our pt must crank in a massive amount of innervational input.

Speaking of Hering's law... What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?
When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, **which eye is fixating has an enormous effect on the amount of innervational input**.
Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervational input will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to cause the eye to ADduct, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervational input will be sent to the (intact) LMR, causing this eye to way over-ADduct, thereby producing a large increase in the measured ET.

Speaking of Hering’s law...What determines the total amount of innervational input the eyes receive? It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.
Sherrington’s Law vs Hering’s Law

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? **If he fixates with his intact left eye**, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye to right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR. Since it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to abduct the eye, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervation will be sent to the (intact) LMR, causing this eye to way over-adduct, thereby producing a large increase in the measured ET.

**Hering’s law:**
It is determined by the amount of innervation needed for the fixating eye to get into and maintain position

_OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?_
When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, **which eye is fixating has an enormous effect on the amount of innervational input.**
Sherrington’s Law vs Hering’s Law

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? **If he fixates with his intact left eye**, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR, given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to abduct the eye, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervation will be sent to the (intact) LMR, causing this eye to way over-adduct, thereby producing a large increase in the measured ET.

The amount of strabismus present while the pt fixates with the nonparetic eye is called the **primary** deviation.

Hering’s law: It is determined by the amount of innervation needed for the fixating eye to get into and maintain position

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, **which eye is fixating has an enormous effect on the amount of innervational input.**
Pt with left LR palsy

OD fixating (= primary deviation)
Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to abduct the eye, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervation will be sent to the (intact) LMR, causing this eye to way over-adduct, thereby producing a large increase in the measured ET.

The amount present while the pt fixates with the paretic eye is called the secondary deviation. The amount present while the pt fixates with the nonparetic eye is called the primary deviation. Hering’s law is the reason these measurements are not identical, and why the secondary deviation is always larger.

**Sherrington’s Law vs Hering’s Law**

**Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

**Hering’s law**: Innervation to yoke muscles is equal. It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?

When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.
Sherrington’s Law vs Hering’s Law

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to abduct the eye, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervation will be sent to the (intact) LMR, causing this eye to way over-adduct, thereby producing a large increase in the measured ET.

The amount present while the pt fixates with the paretic eye is called the **secondary deviation**.

Hering’s law: It is determined by the amount of innervation needed for the fixating eye to get into and maintain position.

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating?

When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, **which eye is fixating has an enormous effect on the amount of innervational input.**
Pt with left LR palsy

OS fixating (= secondary deviation)
Sherrington’s Law vs Hering’s Law

Consider a pt with a paretic right lateral rectus (RLR). As expected, his muscle balance is ET. What happens when he looks at an object to his right? If he fixates with his intact left eye, a normal, moderate amount of innervational input to the left medial rectus (LMR) is all that is required to get this eye into right gaze. And by Hering’s law, an equivalent moderate amount of innervation will be sent to the RLR. Given that it is paretic, the moderate innervational input it receives will not produce much abduction, and the measured ET will increase only modestly.

Next consider what happens if the pt fixates the same object of regard to his right, but this time with the paretic right eye. To get the paretic RLR to contract enough to abduct the eye, our pt must crank in a massive amount of innervational input. By Hering’s law, we know the same (massive) amount of innervation will be sent to the (intact) LMR, causing this eye to way over-adduct, thereby producing a large increase in the measured ET.

The amount of strabismus present while the pt fixates with the nonparetic eye is called the primary deviation. The amount present while the pt fixates with the paretic eye is called the secondary deviation. Hering’s law is the reason these measurements are not identical, and why the secondary deviation is always larger.

Hering’s law

OK, but both eyes are pointing at the same thing. Why would it matter which is fixating? When the oculomotor control system is intact, it doesn’t. But when one eye has a paretic muscle, which eye is fixating has an enormous effect on the amount of innervational input.
Pt with left LR palsy (side-by-side for comparison purposes)

OD fixating (= primary deviation)          OS fixating (= secondary deviation)
Define **Sherrington’s law** and **Hering’s law**, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. 
  - Violated in...  

- **Hering’s law**: Innervation to yoke muscles is equal.
Define **Sherrington’s law** and **Hering’s law**, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: *increased* innervation to a muscle is accompanied by *decreased* innervation to its antagonist
  - Violated in... **Duane syndrome**

- **Hering’s law**: Innervation to *yoke muscles* is equal
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

**What is the cause?**
The nucleus for cranial nerve VI is missing, and the lateral rectus is innervated by cranial nerve III

How does this dysinnervation result in the key findings listed above?
When someone with an intact oculomotor system adducts an eye, Sherrington’s law dictates that innervation is increased to the medial rectus and decreased to the lateral rectus. However, in a Duane’s pt CN3 innervates the LR, so when she attempts to adduct her eye, innervation is increased to both the medial rectus and the aberrantly-innervated lateral rectus, so the eye doesn’t adduct. And when two muscles on opposite sides of the eye contract simultaneously, the net result will be that the eye will retract. Further, if this co-contraction is sufficiently vigorous, one or the other rectus muscle might ‘slip’ upwards or downwards, causing the eye to up- or downshoot.
Define **Sherrington’s law** and **Hering’s law**, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist
  - Violated in… **Duane syndrome**
- **Hering’s law**: Innervation to yoke muscles is equal
  - Violated in… **strabismic condition** (3 words)
Define **Sherrington’s law** and **Hering’s law**, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist
  - Violated in... **Duane syndrome**

- **Hering’s law**: Innervation to yoke muscles is equal
  - Violated in... **dissociated vertical deviation (DVD)**
Define Sherrington’s law and Hering’s law, and for each state the classic example in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist. Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal. Violated in dissociated vertical deviation (DVD).

Who is the typical DVD pt?

A child with infantile/congenital ET or XT

What is the classic clinical finding?

An eye will slowly elevate and extort, either spontaneously (manifest DVD) or when occluded (latent DVD). A crucial finding occurs when the drifting eye reorients downward, and it is this— the fellow eye does not move downward simultaneously (as would normally be the case).

How does Hering’s law relate to DVD?

As noted, in DVD the downward reorientation movement by the drifting eye is not accompanied by a downward movement of the fellow eye. As the muscles that depress the eyes are yoke muscles, this means that DVD represents a violation of Hering’s law.
• Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

- **Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.
  - Violated in Duane syndrome.

- **Hering’s law**: Innervation to yoke muscles is equal.
  - Violated in dissociated vertical deviation (DVD).

**Who is the typical DVD pt?**
A child with infantile/congenital ET or XT

**Hering’s law**: Innervation to yoke muscles is equal.

**dissociated vertical deviation (DVD)**
Define Sherrington’s law and Hering’s law, and for each state the classic example of a strabismus-type in which it is violated:

**Sherrington’s law**: Increased innervation to a muscle is accompanied by decreased innervation to its antagonist.

Violated in… Duane syndrome.

**Hering’s law**: Innervation to yoke muscles is equal.

Violated in… dissociated vertical deviation (DVD).

Q
