Measure 388: Cataract Surgery with Intra-Operative Complications (Unplanned Rupture of Posterior Capsule requiring unplanned vitrectomy)

**Reporting Options:** Registry, Cataracts Measures Group

**Quality Domain:** Patient Safety

**Description:** Rupture of the posterior capsule during anterior segment surgery requiring vitrectomy

**Instructions:** This measure calculates the number of cataract surgery cases with unplanned rupture of the posterior capsule requiring vitrectomy during the reporting period. This measure is intended to reflect the quality of services provided for the patient receiving cataract surgery.

**Note:** This is an outcomes measure and will be calculated solely using registry data.

- For patients who receive the surgical procedures specified in the denominator coding in the sample, it should be reported whether or not the patient had a rupture of the posterior capsule during anterior segment surgery requiring vitrectomy.

**Denominator Instructions:** Total number of cataract surgery cases of patients at any age.

**CPT Codes:** 66840, 66850, 66852, 66920, 66930, 66940, 66982, 66983, 66984

**Note:** Clinicians who indicate modifier 55, postoperative management only OR modifier -56, preoperative management only, will not qualify for this measure.

**Note:** Cases with preoperative posterior capsule rupture will not qualify for this measure.

**Category II Codes:**

- A lower calculated performance rate for this measure indicates better clinical care or control.

**G9389** Unplanned rupture of the posterior capsule requiring vitrectomy

or

**G9390** No unplanned rupture of the posterior capsule requiring vitrectomy

**Rationale:** Unplanned anterior vitrectomies are performed following cataract surgery when vitreous inadvertently prolapses into the anterior segment of the eye. This may result in poor visual outcome
and additional complications, including retinal detachment.\textsuperscript{1} Studies have shown unplanned Vitrectomy Rates ranging from 1\% to 4\%.\textsuperscript{2} The literature states that this complication occurs more commonly for inexperienced surgeons.\textsuperscript{3}
